

Preface

The APHRS was founded in 2008 with its goal to establish infrastructure for basic and clinical researches in the arrhythmia field of Asia-Pacific countries, to provide systematic educational opportunities for young researchers and clinicians wanting to specialize in this field, and to promote multinational researches.

In 2010, the need of White Book focusing on basic statistical data and current status of interventional therapies of cardiac arrhythmia in Asia-Pacific countries has been keenly felt.

The interventional therapies for cardiac arrhythmia have developed rapidly in Asia-Pacific region within past few decades. There is a rapidly growing trend in electrophysiological procedures and implantation of cardiac implantable electronic devices (CIEDs) in most of Asia-Pacific countries. However, significant inequalities exist in healthcare and treatment of cardiac arrhythmia across Asian countries and regions, which make it important and necessary for the healthcare community to share, recognize, and communicate with each other on the data and information relating to current status of cardiac electrophysiology and arrhythmia treatment. We hope annually updated White Book will not only promote scientific, technological, and clinical development for better therapy of cardiac arrhythmia but also improve and equalize healthcare for patients across countries and regions in Asia.

The APHRS White Book reports the most updated information about today of activities in the field of arrhythmia treatment encompassing country demographics, epidemiology of cardiac arrhythmia, implantation of CIEDs (pacemaker, cardiac resynchronization therapy, and implantable cardioverter defibrillator), procedures of interventional electrophysiology, obstacles to guideline implementation, etc. Since Professor Shu Zhang first presented valuable data across 7 countries in the scientific session of APHRS 2012, we decided to publish the first edition of the APHRS White Book during the scientific session of APHRS2013.

This second edition of the APHRS White Book 2014 includes data from 11 countries and regions on the use of CIEDs and electrophysiological procedures in the past three years. Data collection is mostly the result of voluntary participation of national Society of Pacing and Electrophysiology or national Heart Rhythm Society in each country or region. In some

other Asia countries, there are currently no registries or the data is limited. Thus, the APHRS White Book can be a cradle of international registry or collaboration and also provocative to adopt a systematic approach to collect data on arrhythmia therapies in each country. We hope more Asian countries and regions will participate in the future edition of APHRS White Book.

With the release of this second edition of the APHRS White Book, the APHRS appreciate the effort made by all authors, chairs and co-chairs from each of individual national HRS working groups, and expresses special thanks to Professor Shu Zhang, China, who devoted his precious time to annually updated APHRS White Book.

Young-Hoon Kim, MD.

President
APHRS

Acknowledgement

As a member of APHRs and the chief editor of this book, I would like to express my deepest joy and appreciation for the publication of the first edition of the APHRs White Book. I owe particular thanks to the current president of APHRs, Professor Young-Hoon Kim, immediate past president of APHRs, Professor Shih-Ann CHEN who led the preparation of this edition of the APHRs White Book. I would also like to thank our board members for their support of this work. I will express my appreciation to our contributors, the national Society of Pacing and Electrophysiology and the national Heart Rhythm Society of 11 member countries or regions of Asia. Without their voluntary collection of data, the publication of this book would not have been possible. In addition, I am very grateful to members of my working group, Dr. Xiaohan Fan and Miss. Na Lin, especially to Shigeno, secretary of our society, they performed the secondary research to cross verify and establish the quantitative and qualitative information contained in the book.

Chief editor of the APHRs White Book

The APHRS White Book: Second edition

-The current status of cardiac electrophysiology in APHRS member countries

Shu Zhang*, M.D.

Professor of Medicine, Chief of Department of Cardiology

Director of Clinical EP Lab and Arrhythmia Center

National Center for Cardiovascular Disease & Fu Wai Cardiovascular Hospital,

Chinese Academy of Medical Sciences & Beijing Union Medical College

President, Chinese Society of Arrhythmias

1. Foreword

The publication of the First edition of White Book of Asia Pacific Heart Rhythm Society (APHRS) represents a successful attempt by the leading of APHRS to serve its principle mission: to promote excellence and advancement in the diagnosis and treatment of the patients with heart rhythm disorders. The APHRS white book provided valuable update information about current status of activity in the field of arrhythmia treatment encompassing country demographics, epidemiology of cardiac arrhythmia, implantation of CIEDs (pacemaker, cardiac resynchronization therapy, and implantable cardioverter defibrillator), procedures of interventional electrophysiology, and obstacles to guideline implementation etc. Under the leadership by president Professor Young-Hoon KIM and immediate past president Professor Shih-Ann CHEN, the second edition of APHRS White Book offers data of electrophysiological procedures and CIEDs from 11 member countries and regions of the APHRS: mainland China, India, Japan, Korea, New Zealand, Philippines, Singapore, Malaysia, Taiwan, Hong Kong and Thailand. We are so happy to have data from Malaysia, a new participant in the second edition of APHRS White Book, although Malaysia provided only data for 2013 and 2014 (partly). The Data collection is mostly the result of voluntary participation of each national Society of Pacing and Electrophysiology or national Heart Rhythm Society. We hope the APHRS White Book will become a key reference for those seeking information about electrophysiological procedures and CIEDs in Asia-Pacific countries.

2. Methodology

A primary research was conducted within national Heart Rhythm Societies or working groups of cardiac pacing and electrophysiology of each country. Each chairman of the societies and/or working groups was asked to compile information about their country for the year 2011, 2012, and 2013 based on a questionnaire. Secondary research has been conducted with the help of reliable official online databases to cross verify the information reported here. Three major source of information

have been used: healthcare data were extracted from the World Health Organization (WHO) (<http://www.who.int>), whereas demographic information were taken by the United States Census Bureau International Database (<http://www.census.gov>), and finally, the source of economic information has been the International Monetary Fund (IMF) World Economic Outlook Databases (<http://www.imf.org>). A total of 10 APHRS member countries and regions provided their data. The analysis was performed on the trend of device implantation and catheter ablation from 2011 to 2013, and the device implantation rates or catheter ablation rates and procedure centers in 2013.

3. Permanent Pacemaker Implantation

3.1 Increase in pacemaker implantation:

The increasing trend of more than 5.0% of the implantation of permanent pacemaker was seen in Philippines, Singapore, Korea, and India in 2013 compared with 2012. Data from Philippines, the implantation of permanent pacemaker increased 78.3%, from 779 in 2012 to 1389 in 2013. The pacemaker use was also increased significantly by almost 32.0% last year in India, from 27518 to 36,322. The increase rates in pacemaker implantation were 15.3% in Singapore and 9.9% in Korea (3541 to 3890) from 2012 to 2013. The overall use of pacemaker remained constant last year as compared with 2012 in Japan (59487 vs. 59441), New Zealand (2200 vs. 2100), Taiwan (4156 vs. 4043), and mainland China (51752 vs. 49502).

3.2 Pacemaker implantation rate

Data for 2013 were analyzed by evaluating pacemaker implantation rates. Across the 11 countries and regions, a marked heterogeneity was observed in the pacemaker implantation rate per million inhabitants (Table 1) with the highest reported implantation rate in New Zealand (488.9) and Japan (467.3). The large gap in the number of pacemaker implanting center per million inhabitants still remained among the 11 countries and regions. Based on data 2013, there were 4.4 implanting centers per million inhabitants in Taiwan and 2.8 in Korea. By contrast, the countries with lowest density of implanting centers were Philippines (0.6), Malaysia (0.6), India (0.7) and mainland China (0.7). Significant differences were also noted in the pacemaker implants per center, 163 implants per center were performed in New Zealand, 121.5 in India, 56.4 in mainland China 44.7 in Japan, while the numbers of implants/center were only 22.9 in Korea, 25.8 in Philippines. In general, the reported data presented different features in each country. For example, Japan had the highest total number of pacemaker implantations (59209) and implantation rate per million inhabitants (464.5) in 2011, but a relatively low number of implants (44.7) per center. By contrast, New Zealand had the lowest total number of pacemaker use (1956) in 2011, but a relatively higher implantation rate per million inhabitants (455.9) and implantations per center (163). The influence of GDP was also analyzed by evaluating implantation rate per million inhabitants in countries with different GDP per capita. Obviously, the countries with highest GDP per capita of the 7 countries and regions were

Japan, Korea, New Zealand and Taiwan, and the countries with highest implantation rate per million inhabitants were also Japan, and New Zealand, then Taiwan (170.2), and Korea (65.8). Whereas the country with lowest GDP per capita and implantation rate per million inhabitants was Philippines.

4. ICD and Cardiac Resynchronization Therapy devices (CRT)

4.1 Three-year trends in implantation of ICD

The implantation of ICD has increased over time from 2010 through 2013 in almost all APHRS countries and regions. Japan was the country with highest ICD implantation in Asia-Pacific regions, and the ICD use was increased by 26% from 5059 in 2011, and 6373 in 2013. We also observed a significant increase in ICD implantation in India (63.8%), Korea (51.6%), and Thailand (35.9%) through the last three years. However, the increase in ICD use compared to last year was slightly placid in Singapore (from 309 in 2012 to 293 in 2013), mainland China (from 1553 in 2012 to 1903 in 2011), and in New Zealand (from 535 in 2012 to 560 in 2013). Although Philippines is the country with the lowest implants of ICD in Asia-Pacific regions, the increase was great of 60.0%, from 30 in 2011 to 48 in 2013.

Five countries provide additional unique information on ICD primary or secondary prevention: mainland China, Korea, Singapore, New Zealand, and Taiwan. The use of ICD for primary prevention has significantly increased in mainland China (from 42.7% in 2012 to 44.9% in 2013), and Korea (from 28.4% in 2012 to 52% in 2013). However, a slightly decrease in ICD use was observed in Singapore (from 56.3% in 2012 to 37.5% in 2013) and New Zealand (from 37.9% in 2012 to 36.9% in 2013). In Taiwan, the ratio of ICD implantation for primary prevention was 0 in 2013.

4.2 ICD implantation rate

It was reported a total number of 13033 ICD implants across the 11 countries and regions in 2013. New Zealand was still the Country with highest reported ICD implantation rate per million inhabitants (124) (Table 1). Singapore (54.3) and Japan (50) were the other countries with high ICD implants/million, while Taiwan had 16.2, Korea had 13.0, Thailand had 9.8 ICD implants/million. Philippines (0.4), mainland China (1.4), and India (1.5) were the countries with lowest ICD implants/million. The available data also showed a large gap among the 11 countries and regions in the number of ICD implanting center per million inhabitants. The countries with more than 1 ICD implanting centers per million inhabitants were Korea (1.8), Taiwan (1.8), and New Zealand (1.3) in 2013. The number of ICD implanting centers increased from 4 in 2011 to 6 in 2013 in New Zealand. By contrast, the other countries with less than 1 implanting centers per million inhabitants included Singapore (0.9), India (0.3), Philippines (0.009), and mainland China (0.3). It might be just because New Zealand had the high ICD implants/million and less implanting centers, the highest implants per center were recorded in New Zealand (93.3). The numbers of ICD implants/center were only 6.0 in Korea, 4.8 in Philippines, 5.9 in mainland China, and 5.7 in India.

4.3 CRT utilization in Asia-Pacific area

The rising trend in CRT implants was similar to the implantation of ICD in Asia-Pacific countries and regions from 2010 through 2013. The countries with total number of CRTs implantation more than 1000 in 2013 still were Japan, India, and mainland China, with the highest CRT implantation in Japan (4260). The increase in CRT implantation was slightly decreased compared with previous 3 years, 20.6% in mainland China, from 1822 in 2011 to 2198 in 2013, by 51.8% in India, from 1205 in 2011 to 1830 in 2013, and by 10.1% in Japan, from 3868 in 2011 to 4260 in 2013. The reported total number of CRT implantation in other countries and regions also exceeded 100 in 2013 except for Philippines. And a significant increasing trend in CRT implantation was also observed in Korea (from 100 in 2011 to 166 in 2013), in Singapore (from 87 in 2011 to 129), and Philippines (from 14 in 2011 to 18 in 2013). The CRTs use was slightly placid in Taiwan (from 208 in 2011 to 162 in 2013). However, no data were available for New Zealand and Hong Kong.

The collected data showed a total number of 8971 CRT implants in 9 Asia-Pacific countries and regions in 2013. The number of implants continued showing great heterogeneity from as low as 0.2/million (Philippines) to as high as 33.5/million (Japan). In Taiwan, 6.8 implants/million were performed, while India had only 1.5, Korea 3.2, mainland China had 1.6. There was also significant variability in the ratio of CRT-D/CRT-P implants. The ratio of CRT-D implants was 78.1% in Japan, 90.4% in Korea, 43.7% in India, 55.5% mainland China, and 18.7% in Taiwan. CRT implantation is still technically challenging and is not performed in all pacemaker implanting centers. The number of "CRT centers" shows great geographical variability

5. Catheter Ablation

5.1 General information of Catheter Ablation

Nine countries and regions submitted their data of catheter ablation. The number of ablation procedures was significantly higher in mainland China, and Japan than those in other countries and regions. Also an increasing trend was observed in ablation procedures across all 9 countries and regions from 2011 to 2013. In mainland China, the catheter ablations increased significantly from 63355 in 2011 to 83450 in 2013, and which also rose in Japan from 38000 in 2011 to 46000 in 2013. The total number of ablations was less than 10000 in other countries and regions (Korea, India, Philippines, Malaysia, New Zealand, Singapore, and Taiwan).

5.2 Ablation procedure rates

By 2013, a total number of 154,399 ablations were reported in 9 Asia-Pacific countries and regions (mainland China, Japan, Korea, India, Philippines, Singapore, New Zealand, and Taiwan). As shown in Table 2, the highest number of ablation procedures per million inhabitants was recorded in Japan (361.3), New Zealand (160), and Taiwan (117.8), and the lowest in India (10.7) and Philippines

(0.8). In mainland China, only 61.8 ablation procedures/million inhabitants were performed. Regarding ablation centers per million inhabitants in 2013, the highest density was recorded also in Japan (4.3) and the lowest in India (0.1). The distribution of ablation procedures per center also showed a marked heterogeneity. It was reported 107.7 ablation procedures/center in mainland China, 103.8/center in Korea, 66.7/center in Japan, 53.3/center in India, and only 5.8/center in Philippines. The data also showed a significant impact of GDP on the catheter ablation rate per million inhabitants. The top 3 countries with GDP per capita above 30 thousands US dollars in 2011 were Japan, Korea, and Taiwan. The three countries were also the top 3 countries with the high number of ablation procedures per million inhabitants. By contrast, Philippines and India were lowest of the both GDP and ablation procedures/million.

5.3 Atrial fibrillation (AF) catheter ablation

In this edition, we got more the data of AF ablation compared with last year, including data from Japan, mainland China, Korea, Taiwan, Malaysia, India, New Zealand, Philippine, and Singapore (no data available for Hong Kong and Thailand) although data were not available in some countries. However, with the increase in AF ablation procedures, the increase rates decreased in some countries. Japan was still the country with the highest number of AF ablation procedures since 2009. Compared with 2012, the AF ablations in 2013 significantly increased by 19% (from 21,000 to 25,000) in Japan, and by 31.5% in mainland China (from 11214 to 14752). There was also an increase of 27.0% in the number of AF ablations from 2012 to 2013 in Korea (from 1561 to 1983). Taiwan showed a flat trend in the AF catheter ablations over the past three years (410 in 2011, 450 in 2012, and 434 in 2013). Across the 9 countries and regions with available data for 2013 (Table 2), a total number of 39305 AF ablation procedures were performed, with the highest reported AF ablation rate per million inhabitants in Japan (196.4), and the low ablation rate in India (0.6) and Philippine (0.06). The number of AF ablations per million inhabitants was 38.7 in Korea. Regarding the ratio of AF/total ablations, there was also a large gap among 9 countries and regions, with highest reported AF ablation ratio in New Zealand (56%) and Japan (54.3%), and lowest AF ablation ratio in India (5.6%). And the AF ablation ratio was 45.3% in Korea, 17.8% in mainland China, and 15.8% in Taiwan, which was increased compared to last year.

6. Conclusion and future work

The current report just brings together the data on implantation of cardiovascular electronic devices and electrophysiological procedures in 11 APHRS countries and regions. Primary analysis of these data showed a growing trend in arrhythmia interventional treatment in many Asia-Pacific countries and regions. However, there is still a great gap between Asian and Western countries. The data also highlight significant inequalities covering all arrhythmia interventional therapies in Asia-Pacific countries. The overview of these data indicated that more supervision, cardiac

education training and guideline implementation are needed to promote the development of arrhythmia interventional therapy. The APHR White Book needs indispensable support and participation of all member countries in Asia-Pacific regions. But in some Asian countries, currently there are no registry data available. The APHR White book may serve as motivation for these countries to adopt a systematic approach to key data on arrhythmia therapy in the future.

Table 1. The CIEDs implantation rates and implanting centers per million inhabitants for the year 2013 in 11 Asia-Pacific countries and regions

| Countries and regions | Pacemaker implantation rate/million inhabitants | Pacemaker implanting centers/million | ICD implantation rate/million inhabitants | CRT implantation rate/million inhabitants | ICD/CRT implanting centers/million |
|-----------------------|---|--------------------------------------|---|---|------------------------------------|
| Mainland China | 38.3 | 0.7 | 1.4 | 1.6 | 0.3 |
| Hong Kong | 74.6 | No data | 10.9 | No data | No data |
| India | 29 | 0.7 | 1.5 | 1.5 | 0.3 |
| Japan | 467.3 | No data | 50 | 33.5 | No data |
| New Zealand | 488.9 | 2.7 | 124 | 21 | 1.3 |
| Philippines | 13.1 | 0.6 | 0.4 | 0.2 | 0.09 |
| Singapore | 114.5 | 0.9 | 54.3 | 23.9 | 0.9 |
| South Korea | 75.9 | 2.8 | 13 | 3.2 | 1.8 |
| Taiwan | 177.8 | 4.4 | 16.2 | 6.8 | 1.8 |
| Thailand | 35.6 | 0.8 | 9.8 | No data | 0.8 |
| Malaysia | 19.4 | 0.6 | 4.0 | 3.7 | 0.4 |

Table 2 The ablation procedure rate and centres per million inhabitants for the year 2013 in 11 Asia-Pacific countries and regions

| Countries and regions | Ablation procedure rate/million inhabitants | Ablation centers/million inhabitants | AF ablation rate/million inhabitants | AF ablation centres/million inhabitants | AF ablation/abltion procedure |
|-----------------------|---|--------------------------------------|--------------------------------------|---|-------------------------------|
| Mainland China | 61.8 | 0.55 | 10.9 | 0.3 | 17.8% |
| Hong Kong | No data | No data | No data | No data | No data |
| India | 10.7 | 0.1 | 0.6 | 0.01 | 5.6% |
| Japan | 361.3 | 4.3 | 196.4 | 2.8 | 54.3% |
| New Zealand | 160 | No data | 51 | 0.9 | 56% |
| Philippines | 0.8 | No data | 0.06 | No data | 8.5% |
| Singapore | 100 | 0.4 | 15.2 | 0.4 | 15.2% |
| South Korea | 85.4 | 1.0 | 38.7 | 0.7 | 45.3% |
| Taiwan | 117.8 | 0.4 | 18.6 | 0.3 | 15.8% |
